

15-213 Recitation: Attack Lab

Jenna MacCarley

28 Sep 2015

Reminder

- Bomb lab is due **tomorrow!**
- Attack lab is released **tomorrow!!**

Agenda

- Stack review
- Attack lab overview
 - Phases 1-3: Buffer overflow attacks
 - Phases 4-5: ROP attacks

x86-64: Register Conventions

- Arguments passed in registers:
%rdi, %rsi, %rdx, %rcx, %r8, %r9
- Return value: %rax
- Callee-saved: %rbx, %r12, %r13, %r14,
%rbp, %rsp
- Caller-saved: %rdi, %rsi, %rdx, %rcx,
%r8, %r9, %rax, %r10, %r11
- Stack pointer: %rsp
- Instruction pointer: %rip

x86-64: The Stack

- Grows **downward** towards **lower** memory addresses
- `%rsp` points to **top** of stack

- `push %reg`: subtract 8 from `%rsp`, put val in `%reg` at `(%rsp)`
- `pop %reg`: put val at `(%rsp)` in `%reg`, add 8 to `%rsp`

x86-64: Stack Frames

- Every function call has its own **stack frame**.
- Think of a frame as a workspace for each call.
 - Local variables
 - Callee & Caller-saved registers
 - Optional arguments for a function call

x86-64: Function Call Setup

Caller:

- Allocates stack frame large enough for saved registers, optional arguments
- Save any caller-saved registers in frame
- Save any optional arguments (in **reverse order**) in frame
- `call foo`: push `%rip` to stack, jump to label `foo`

Callee:

- Push any callee-saved registers, decrease `%rsp` to make room for new frame

x86-64: Function Call Return

Callee:

- Increase `%rsp`, pop any callee-saved registers (in **reverse order**), execute `ret: pop %rip`

Attack Lab Overview: Phases 1-3

Overview

- Exploit x86-64 by overwriting the stack
- Overflow a buffer, overwrite return address
- Execute injected code

Key Advice

- Brush up on your x86-64 conventions!
- **Use objdump -d** to determine relevant offsets
- **Use GDB** to determine stack addresses

Buffer Overflows

- Exploit *strcpy* vulnerability to overwrite important info on stack
- When this function returns, where will it begin executing?
 - Recall

```
ret: pop %rip
```
- What if we want to inject new code to execute?

Demonstration: Generating Byte Codes

- Use **gcc** and **objdump** to generate byte codes for assembly instruction sequences

Attack Lab Overview: Phases 4-5

Overview

- Utilize return-oriented programming to execute arbitrary code
 - Useful when stack is non-executable or randomized
- Find gadgets, string together to form injected code

Key Advice

- Use mixture of pop & mov instructions + constants to perform specific task

ROP Example

- Draw a stack diagram and ROP exploit to **pop a value 0xBBBBBBBB into %rbx** and **move it into %rax**

Gadgets:

address₁: mov %rbx, %rax; ret

address₂: pop %rbx; ret

```
void foo(char *input){  
    char buf[32];  
    ...  
    strcpy (buf, input);  
    return;  
}
```

ROP Example: Solution

Gadgets:

Address 1: `mov %rbx, %rax; ret`

Address 2: `pop %rbx; ret`

```
void foo(char *input){  
    char buf[32];  
    ...  
    strcpy (buf, input);  
    return;  
}
```

Old Return
address

buf

Next address in ROP chain....

Address 1

0xBBBBBBBB

Address 2

0xFFFFFFFF

0xFFFFFFFF

0xFFFFFFFF

0xFFFFFFFF

0xFFFFFFFF

0xFFFFFFFF

0xFFFFFFFF

0xFFFFFFFF

0xFFFFFFFF

0xFFFFFFFF (filler.....)

ROP Demonstration: Looking for Gadgets

- How to identify useful gadgets in your code

Tools

- **objdump -d**
 - View byte code and assembly instructions, determine stack offsets
- **./hex2raw**
 - Pass raw ASCII strings to targets
- **gdb**
 - Step through execution, determine stack addresses
- **gcc -c**
 - Generate object file from assembly language file

More Tips

- Draw stack diagrams
- Be careful of byte ordering (little endian)
